THIS FIFTEENTH VOLUME

OF THE
NATURALIST'S MISCELLANY

IS
RESPECTFULLY INSCRIBED

BY
GEORGE SHAW.

E. NODDER.

TETRAO ARENARIA.

CHARACTER GENERICUS.

Rostrum convexum, breve.

Macula prope oculos nuda, aut papillosa, aut plumis rarius tecta.

CHARACTER SPECIFICUS, &c.

TETRAO griseo-flavescens, torque abdomine crissoque (maris) atris.

TETRAO ARENARIA. T. torque, abdomine et crisso atris, rectricibus fusco et griseo fasciatis apice albis, intermediis duabus fulvescentibus.

Lin. Syst. Nat. Gmel. p. 755.

Pall. nov. comm. Petrop. p. 418.

Primus accurate descripsit hanc speciem celeberrimus Pallas in *Academiæ Petropolitanae Commentariis*.

“ Magnitudine hæc avis *Perdicem* superat, habitu *Alchatam* refert. *Rostrum* quam in *perdice* tenuius, prorsus ut in *Alchata*, cinereo cærulescens, apice nigricante. *Palpebræ* nudæ, pallidæ, marginibus subpapillosis, flavescentibus. *Supercilia* plumosa, tecta. *Caput* albido cinereum in masculis, vertice usque

usque in cervicem grisco-flavescenti nebuloso. Gula ferrugineo-fulva, colore versus latera colli diffuso diluto, trianguloque atro submedio collo terminata. Collum jugulumque totum, in hoc sexu, cano albida, plumis vestita singularibus truncatis, densioribus, elasticis, columbarum similibus. Cervix inferior, dorsum totum adusque caudam, alarumque bases plumis testaceo-albidis, annulo singulis fusco terminali, maculam ovatam lutescentem cingente, notatis variantur. Inter pectus et jugulum circulus ater, hinc pectus albidum; sed abdomen, femora, crissum atra. Subcaudales albæ, strigis aliquot transversis nigris. Tectrices primariæ remigibus concolores, canescentes; secundariæ extus luteo-fulvescentes, efficientes quasi speculum alare hujus coloris. Femina paulo major mare differt colore per totum corpus pallide flavescente, in capite, collo, juguloque nigro guttato, in dorso fasciis transversis sagittatis, crebris variegato. Loca incolit deserta circa mare Caspium."

THE
SAND PARTRIDGE.

GENERIC CHARACTER.

Bill convex, short.

Spot near the eyes, either naked, granulated,
or but sparingly covered with feathers.

SPECIFIC CHARACTER, &c.

Yellowish-grey PARTRIDGE with the abdomen, vent, and collar (of the male) black.

Sand Grouse.

Lath. syn. 2. p. 751.

This species seems to have been first accurately described by the celebrated Dr. Pallas, in the Petersburg Transactions. Its size exceeds that of a common partridge, and its habit resembles that of the Alchata: the bill, which is more slender than in the partridge, is of a blueish ash-colour, with a black tip: the eye-lids naked, pale, and beset with slight yellowish papillæ round the edges: the brows covered with feathers: the head, in the male, of a whitish ash-colour, the crown being clouded as far as the neck with yellowish grey; the
throat

throat orange-ferruginous, growing paler towards the sides of the neck, and terminated below by a black triangle: the neck is whitish-grey, and covered by feathers of a truncated shape, strong, and elastic like those of a pigeon: the remainder of the neck, and the back with pale testaceous feathers, each marked at the tip with a black ring including a yellowish spot: the abdomen, thighs, and vent are black: the smaller wing-coverts, and the quill-feathers are pale grey; but the larger coverts are of an orange-yellow, forming a speculum or oblong spot of that colour on the wings. The female, which is rather larger than the male, is almost entirely of a pale yellowish colour, marked on the head and neck with black specks, and variegated on the back by transverse streaks of the same colour. This bird is an inhabitant of the sandy deserts in the neighbourhood of the Caspian Sea.

PAPILIO PROTENOR.

CHARACTER GENERICUS.

Antennæ apicem versus crassiores, sæpius clavato-capitatae.

Alæ (sedentis) erectæ, sursumque conniventes, (volatu diurno.)

Lin. Syst. Nat. p. 744.

CHARACTER SPECIFICUS, &c.

PAPILIO alis dentatis nigris, anticis stria humerali rubra, posticis annulo rubro ad angulum ani.

PAPILIO PROTENOR. P. alis dentatis nigris, posticis subtus macula difformi rubra anguli ani.

Fabr. spec. ins. 2. p. 7.

Eq. Troj.

Indiam? incolit Papilio Protenor. Pulchrum specimen unde desumpta est figura hæc nostra in Museo celeberrimi Gulielmi Hunter asservatur.

PROTENOR.

GENERIC CHARACTER.

Antennæ gradually thickening towards the tip,
and generally terminating in a knob.

Wings (when sitting) erect and meeting upwards : (Flight diurnal.)

SPECIFIC CHARACTER.

Black Butterfly with denticulated wings, the upper pair marked by a red shoulder-streak, the lower by a red ring at the inner angle.

The *Papilio Protenor* is a native of India? The elegant specimen from which the present figure was taken, is preserved in the Museum of Dr. William Hunter.

CANCER SEBANUS.

CHARACTER GENERICUS.

Pedes octo (rarius sex aut decem :) insuper manus duæ chelatae.

Oculi duo, distantes, plurimis pedunculati, elongati, mobiles.

Cauda articulata, inermis.

CHARACTER SPECIFICUS, &c.

CANCER miniatus, thorace orbiculato, pedibus hirsutis, chela dextra maxima.

CANCER fluviatilis, sive Gammarus Americanus.

Seb. mus. 3. p. 43. t. 18. f. 4.

Americam testante Seba, incolit Cancer hic depictus, “cujus dextri lateris pes insolitæ est crassitiei atque magnitudinis, ut vel reliquis omnibus pedibus, totique simul corpori fere præponderet.”

THE
SEBAN CRAB.

GENERIC CHARACTER.

Legs generally eight ; (in some species six or ten,) besides two claspers or chelated arms.

Eyes two, commonly distant ; footstalked, moveable.

Tail articulated.

SPECIFIC CHARACTER, &c.

Red CRAB with orbicular thorax, hairy feet, and right claw excessively large.

Great-clawed American CRAB.

This Crab, according to Seba, is a native of America, and is remarkable for the excessive size of its right claw, which is said to exceed the weight of all the rest of the animal.

PHYTOLITHUS FILICIS.

In Natura investiganda vix aliud jucundius quam vegetabilium et animalium certissimas reliquias per totum fere orbem sparsas, interdum etiam ipsis animalibus plantisque quæ in iisdem regionibus nunc dierum inveniuntur prorsus dissimiles attentius considerare. In re difficillima etiamnum satis obscura diu inter philosophos pugnatum est variis et sibi invicem contrariis argumentis. At manca fortasse vel adhuc est telluris cognitio, et concedendum certe est hanc nostram a primæva terra longe esse diversam, quam magna sæpe vi convulsam fuisse satis constat et igni aquaque vastatam; adeo ut hodie super rudera quasi et ruinas ambuletur.

Hujusmodi permutationum quamvis causa lateat, vis est notissima. In summis montibus a mari longe remotis, in ipsis etiam Andibus Peruvianis reperiuntur plurima substantiarum marinarum tum animalium tum vegetabilium vestigia, quarum multas cum recentes nunquam viderimus, vel species deperditas putemus necesse est, vel in altissimo oceani profundo latere, unde forsitan nec insana tempestatum vi attolluntur.

In intimis etiam carbonis et schisti stratis manifesta insunt indicia piscium, crustatorum, plantarum, &c; sæpissime autem filicum variarum, quarum aliæ ad species genuinas facile reduci possunt, aliæ vero ad illas referendæ sunt quæ aut diu perierunt, aut adhuc ignorantur. Harum quæ in
Museo

Museo Leveriano spectantur perfectior nulla est quam quæ in tabula cernitur, filix scilicet mas vulgaris seu *Polypodium filix mas Linnæi*, quo specimine vix bellius et integrius vel in ipso *horto sicco* videris, ipsæ enim in foliis fructificationes clare inspici possunt.

De planta vulgatissima speciatim tractare super-
vacaneum foret; per totam fere Angliam in locis incultis et juxta sepes generatur.

Repertum est hoc specimen in fragmento lapidis schistosi immersum.

A

FERN PHYTOLITHUS.

The indisputable remains of animal and vegetable bodies, so plentifully dispersed throughout almost all parts of the globe, and of which a great many are of a widely different appearance from the present natives of the regions in which they are found, form one of the most interesting points of speculation in the history of nature.

Various and even contradictory hypotheses have occasionally been proposed as elucidations of this subject, which yet remains in a considerable degree of obscurity; the true theory of the earth being perhaps still but very imperfectly understood. It must be allowed, however, that vast and violent changes have been wrought in the body of the primeval earth; that we walk as it were on the ruins of the original structure; and that both fire and water have united their forces to derange the first formation.

Of these great convulsions of nature, though the causes yet remain unexplored by all the endeavours of improved philosophy, yet the effects are every where visible.

On the tops of mountains, remotely distant from the sea, even on those of the Andes in Peru, are found the remains of innumerable marine productions, both animal and vegetable; many of which are still unknown in their recent state, and are therefore

fore either lost species, or else such as inhabit the deepest recesses of the ocean, from whence they are scarce ever raised by the utmost violence of storms and tempests.

In deep-laid strata of coal, slate, &c. are found plentiful specimens of fish, crustacea, plants, &c. The most frequent, however, seem to be those of Ferns, of which a great many different kinds are observed ; some easily reducible to their archetypes or proper species, while others appear to belong to species either lost or still unknown.

Among the most complete and curious specimens in the Leverian Museum, is that figured on the annexed plate, which represents in the most perfect manner the well-known European plant called the common male fern, (*Polypodium filix mas.* Lin.) So extremely perfect is this fossil vegetable, that the fructifications are distinctly seen on the leaves nearly in the same state as in a dried specimen.

To particularize the history of so well known a vegetable would be entirely unnecessary : it is sufficient to say that it is principally found in waste places, and by hedge sides, and is produced in most parts of this kingdom. The specimen is imbedded in a fragment of slaty stone.

PIPRA RUPICOLA.

CHARACTER GENERICUS.

Rostrum capite brevius, basi subtrigonum, integerrimum, apice incurvum.

Pedes gressorii.

Lin. Syst. Nat. p. 338.

CHARACTER SPECIFICUS, ♂.

PIPRA RUPICOLA. P. crista erecta margine purpurea, corpore croceo, tectricibus rectricum truncatis.

Lin. Syst. Nat. p. 338.

Upupa Americana lutea.

Ger. orn. 2. p. 64. t. 206.

Coq de roche.

Pl. Enl. 39. ♂ 747.

Avem hanc raram et perpulchram, in Peravia et Surinamia generatam, insignit mira cristæ et tectricum conformatio. Incolit, ut plurimum, rupes et loca cavernosa, magnitudine columbæ minori par. Differt a mari femina penitus infuscata.

THE
ROCK MANAKIN.

GENERIC CHARACTER.

Bill shorter than the head, somewhat triangular at the base, and bent at the tip.

Feet formed for walking.

SPECIFIC CHARACTER, &c.

Orange-coloured MANAKIN, with upright compressed crest, and truncated tail-coverts.

Hoopoe Hen.

Edw. Glean. t. 264.

Coq de roche du Perou.

Buff. ois. 4. p. 437.

Museum Leverianum 1. p. 15. pl. 4.

This rare and beautiful bird is a native of Peru and Surinam, and is remarkable for the singular conformation of its crest and tail-coverts. It is generally seen in the neighbourhood of rocks and caverns, and is about the size of a small pigeon. The female differs from the male in being entirely of a brown colour.

LACERTA AURITA.

CHARACTER GENERICUS.

Corpus tetrapodum, elongatum, caudatum, nudum.

CHARACTER SPECIFICUS, &c.

LACERTA collo utrinque lobo semiorbiculato denticulato.

LACERTA AURITA. L. cauda tereti mediocri utrinque ad latus callosis punctis aspera, plica gulæ transversa subgemella, oris angulis utrinque in cristam semiorbiculatam mollem scabram dentatam dilatatis.

Lin. Syst. Nat. Gmel.

LACERTA Mystacea.

Pall. ih. 3. p. 702.

Luculente adeo et accurate explicuit hanc speciem celeberrimus Pallas ut ipsissima auctoris verba sine ulla immutatione transcribere non dubitaverim.

“ Magnitudo adultis fere supra Geckonem. Caput retusum. Anguli oris dilatati utrinque in cristam semiorbiculatam mollem, extus punctis scabram, margine dentatam, in vivo animale sanguine turgentem.

centem. Parotides utrinque muricatæ; plica gulæ transversa subgemella. Corpus ventricosum, depressum, cum cauda totum punctis acute prominulis scabrum, quæ majora in pedibus. Caudæ latera (in tractu utrinque longitudinali) callulis muricata. Digiti pedum unguiculati, intermediis tres serrati, duo bifariam, interior uno versu. Color supra cinereo et lutescente nebulosus, atomis creberrimis fuscis; subtus sordide albus, litura sterni apiceque caudæ subtus atris. In collibus arenosis Naryn, ut et in deserti Comani sabuletis non infrequens."

THE
LOBE-CHEEKED LIZARD.

GENERIC CHARACTER.

Body four-footed, elongated, tailed ; without any secondary integument.

SPECIFIC CHARACTER, &c.

LIZARD with a semiorbicular denticulated lobe on each side the neck.

LOBE-CHEEKED LIZARD.

General Zoology, vol. 3. p. 244.

This remarkable Lizard is thus accurately described by Dr. Pallas :—

The size of the full-grown animal is somewhat superior to that of the *Lacerta Gecko* : the head is obtuse, and rounded in front ; and the corners of the mouth are dilated on each side into a soft, semiorbicular crest, which is roughened externally with small points, toothed on the edges, and, in the living animal is turgid with blood : the parotids are muricated, and the throat is furnished with a double transverse pleat : the body is ventricose, depressed, and together with the tail is roughened by small sharply prominent points, which are largest on the feet:

feet : the sides of the tail are mucronated in a longitudinal direction with small mucronous points : the toes are furnished with claws, and the three intermediate toes are serrated : two on both sides, and the other only on one : the colour above is a clouded variegation of yellowish and cinereous, with thickly-scattered dusky specks ; beneath dull white, with a black streak on the breast and beneath the tip of the tail. It inhabits the sandy and hilly deserts of Siberia.

SPHINX CLUENTIUS.

CHARACTER GENERICUS.

Antennæ subprismaticæ, utroque fine attenuatæ.

Lingua exserta (plerisque.)

Palpi duo reflexi.

Alæ deflexæ.

CHARACTER SPECIFICUS, &c.

SPHINX alis fuscis subferrugineo-variis, inferioribus basi fasciaque flavis, corpore utrinque luteo-maculato.

SPHINX CLUENTIUS.

Cram. pap. t. 78. f. B. & 126. f. A.

Surinamiam incolit Sphinx Cluentius, magnitudine vera in tabula depictus.

CLUENTIUS.

GENERIC CHARACTER.

Antennæ subprismatic, attenuated at each extremity.

Tongue generally exerted.

Feelers two, reflex.

Wings deflected.

SPECIFIC CHARACTER, &c.

SPHINX with brown wings, with subferruginous variegations ; the lower wings yellow at the base and in the middle, and the body marked on each side by deep-yellow spots.

SPHINX CLUENTIUS.

Cramer, t. 78.

The superb Sphinx here exhibited is a native of Surinam, and is represented on the plate in its natural size.

BUCCINUM RUMPHII.

CHARACTER GENERICUS.

Animal Limax.

Testa univalvis, spiralis, gibbosa.

Apertura ovata, desineus in canaliculum (s. retusam lacunam) dextrum, cauda retusum.

Labium interius explanatum,

CHARACTER SPECIFICUS, &c.

BUCCINUM carneo-flavescens fasciis longitudinalibus undulatis fuscis.

B: tuberosum. var. γ .

Lin. Gmel. p. 3473.

Le Papier marbré.

Knorr. 6. t. 18. f. 1.

Rumph. t. 23. f. c.

E manibus Indicis extrahitur rarissima hæc cochlea, cujus magnitudinem veram cernere est in tabula.

THE
MARBLED BUCCINUM.

GENERIC CHARACTER.

Animal allied to a Slug.

Shell univalve, spiral, gibbous.

Aperture ovate, ending in a channel pointing
towards the right.

Interior Lip expanded.

SPECIFIC CHARACTER, &c.

Yellowish flesh-coloured BUCCINUM, with
longitudinal undulated brown bands.

Le Papier marbré.

Rumph. Knorr. &c.

This very rare shell is a native of the Indian seas,
and is exhibited on the plate in its natural size.

EMBERIZA CIRIS.

CHARACTER GENERICUS.

Rostrum conicum.

Mandibulæ basi deorsum a se invicem discedentes : inferiore lateribus inflexo-coarctata, superiore angustiore.

Lin. Syst. Nat. p. 308.

CHARACTER SPECIFICUS, &c.

EMBERIZA capite caruleo, abdomine fulvo, dorso viridi, pennis viridi-fuscis.

Lin. Syst. Nat. p. 313.

Chloris ludoviciana vulgo Papa dicta.

Briss. av. 3. p. 200.

Fringilla Mariposa.

Scopoli ann. 1. No. 222.

Sive formæ sive colorum habeatur ratio, merito numerari debet Americana hæc avis in pulcherrimis sui generis. Magnitudinem naturalem ostendit tabula. Femina a mare differt corpore supra viridi, subtus flavescente.

THE
PAINTED EMBERIZA.

GENERIC CHARACTER.

Bill conical : Mandibles separating a little from the base downwards : the sides of each mandible bending rather inwards.

SPECIFIC CHARACTER, &c.

Green EMBERIZA, with blue head, fulvous abdomen, and brownish-green wing-feathers.

The painted Finch.

Edw. pl. 130.

Le Pape.

Buff. ois. 4. p. 176.

Pl. Enl. 159. f. 1.

This species, which is a native of many parts of America, may be considered as one of the most elegant and beautiful of its tribe : it is represented on the plate in its natural size : the female differs from the male in being green above, and yellowish beneath.

ANARHICHAS PANTHERINUS.

CHARACTER GENERICUS.

Caput obtusiusculum.

Dentes primores supra infraque conici, divergentes, sex pluresve.

Molares inferiores palatique rotundati.

Membr. branch. radiis sex.

Corpus teretiusculum, pinna caudæ distincta.

CHARACTER SPECIFICUS, &c.

ANARHICHAS luteus, maculis rotundatis fuscis.

ANARHICHAS PANTHERINUS. A. maculis per totum corpus rotundis fuscis.

Zouiew act. Petrop. 1781.

Lin. Syst. Nat. Gmel. p. 1144.

In Actis Petropolitans primum descripta fuit hæc species, cujus longitudo tres circiter pedes æquat.

“ Corpus teretiusculum, ventricosum, lanceolatum, a medio ventre, ubi crassities ejus maxima est, ad caudam, sensim decrescens, nudum, lubricum, squamarum loco punctis minoribus concoloribus adpersum; cute firma, densa, coloris luteo-flavescentis, maculis per totum corpus et pinnam

dorsalem, excepta parte prona, rotundis, fuscis, majoribus notatum. Caput subglobosum; labia duplicata; rictus amplus; palato inserti dentes septem; oculi majusculi; dissiti; branchiarum apertura lunata, coarctata, opercula ex laminis duabus conflata; pinnae pectorales amplissimae, rotundatae; anus post medium corporis ad exordium pinnae ani: linea lateralis nulla: cauda lanceolata, ad pinnam subcaudalem torosior quam ad dorsalem.

“ Habitat in Oceano Septentrionali et Mari Albo. A Russis in esum non trahitur etiamsi caro ejus laudetur.”

THE
PANTHER ANARHICHAS.

GENERIC CHARACTER.

Head rather obtuse.

Fore-Teeth both above and below conical, divergent, strong, six or more in number.

Grinders in the lower jaw and palate rounded.

Gill Membrane six-rayed.

Body roundish : tail-fin distinct.

SPECIFIC CHARACTER, &c.

Yellow Wolf-Fish, with rounded brown spots.

The Panther Wolf-Fish.

This species, which measures about three feet in length, seems to have been first described in the Petersburg Transactions. The body is subcylindric, ventricose, and lanceolate, gradually decreasing from the middle of the abdomen, where it is thickest, to the tail. It is naked, slippery, and beset in place of scales with small points of the same colour with the skin, which is thick and strong, and of a deep yellow, marked throughout the whole body except the under part, as well as on

the dorsal fin, with round, large, dusky spots : the head is subglobose ; the lips doubled, and the gape wide : in the palate are inserted seven teeth : the eyes are rather large and distant : the branchial apertures lunated and straitened, and the gill-covers consist of two plates on each side : the pectoral fins are very large and rounded : the vent is situated beyond the middle of the body, at the beginning of the anal fin : the lateral line is wanting : the tail is lancolate, and is thicker towards the subcaudal fin than towards the dorsal one. It is a native of the Northern and White Seas, and though the flesh is said to be agreeable, is not eaten by the Russians.

MUREX FEMORALE.

CHARACTER GENERICUS.

Animal Limax.

Testa univalvis, spiralis, exasperata suturis membranaceis.

Apertura desinens in canalem integrum, rectum seu subadscendentem.

Lin. Lyst. Nat. p. 1213.

CHARACTER SPECIFICUS.

MUREX FEMORALE. M. testa varicibus decussatis trigona rugosa anterieus nodulosa, apertura edentula anterieus transversa.

Lin. Syst. Nat.

Gualt. test t. 50. f. c.

Seb. Mus. 3. t. 63. f. 7.—10.

Regenf. Conch 1. t. 2. f. 21.

Maria Indica præcipue incolit elegans conchylium magnitudine vera in tabula depictum.

984

665

THE
FEMORAL MUREX.

GENERIC CHARACTER.

Animal allied to a Slug.

Shell univalve, spiral, commonly roughened
by membranaceous sutures.

Aperture, terminating in a strait or subascend-
ing channel.

SPECIFIC CHARACTER, &c.

Yellow-brown roughened MUREX, with sub-
trigonal ventricose body, and toothless
aperture.

Argenv. t. 10. f. B. ?

Grew. Mus. Reg. Soc. t. 10. f. 4. ?

This elegant shell is chiefly found in the Indian
Seas, and is represented on the plate in its natural
size.

PAPILIO AMPHITRYON.

CHARACTER GENERICUS.

Antennæ apicem versus crassiores, sæpius clavato-capitatae.

Alæ (sedentis) erectæ sursumque conniventes (volatu diurno.)

CHARACTER SPECIFICUS, &c.

PAPILIO alis anticis apice flavo-maculatis, posticis fascia flavescente, subtus lunulis cæruleis.

PAPILIO AMPHITRION. P. alis nigris fascia inæquali flava, posterioribus subtus strigæ punctis flavis lunulisque cæruleis.

Lin. Syst. Nat. Gmel. p. 2247.

PAPILIO AMPHITRYON.

Cram. t. 7. f. A. B.

Eq. Archiv.

Americæ Australis partes calidiores incolit Papilio Amphitryon, coloribus interdum leviter varians. Magnitudinem veram ostendit tabula.

44
C. 3

AMPHITRYON.

GENERIC CHARACTER, &c.

Antennæ thickening towards the upper part, and generally terminating in a clavated tip.

Wings (when sitting) erect, and meeting upwards. (Flight diurnal.)

SPECIFIC CHARACTER.

Blackish Butterfly, with the upper wings spotted with yellow at the tips, the lower wings marked by a yellowish band, and beneath by a row of blue crescents.

This insect is a native of several parts of South America, and is subject to some slight variation as to colour: the plate represents it in its natural size.

MYCTERIA AUSTRALIS.

CHARACTER GENERICUS.

Rostrum subascendens, acutum, mandibula superiore triquetra.

Frons calva.

Nares lineares.

Pedes tetradactyli.

Lath. ind. orn. p. 670.

CHARACTER SPECIFICUS, &c.

MYCTERIA alba, capite colloque viridi-nigris, tectricibus, pennis scapularibus, caudaque nigris, rostro nigro, pedibus rubris.

MYCTERIA AUSTRALIS.

Lin. Trans. Vol. 5. p. 34.

Generis Mycteriae species Americana seu communis, physicis jamdiu cognita, varias Americae Australis partes, incolit. Species autem quam depinximus, quamque generat Australasia, distat insigniter ab avi Americana, quod caput et collum non denu-
dentur, sed plumis vestiantur saturatim viridibus, qualibus fere collucere solet Anas Boschas mas; splendore insuper versicolori vel in cæruleum vel purpureum transeunte. Rostrum nigrat; et a basi

mandibulæ inferioris dependet extensa aliquatenus in gulam cutis quædam nuda, seu sacculus membranaceus ruberrimus. Cætera avis nivei est candoris, alarum tectricibus omnibus exceptis nigerrimis, nigraque cauda. Crura pedesque ruberrima. Icones accuratissime delineatæ sunt apud Dominum White, coloniæ Britannicæ in Australasia chirurgum præcipuum, unde constat hanc speciem, cum plene adoleveret, Mycteriæ ipsi Americanæ magnitudine esse parem ; sex enim vel septem pedes alta depingitur. Specimen autem nostrum quod ostendit tabula, quodque in Museo Leveriano asservatur, vix quinque pedes superat.

THE
AUSTRALASIAN JABIRU.

GENERIC CHARACTER.

Bill subascendant, sharp, with the upper mandible triquetrous.

Front bare.

Nostrils linear. *Feet* tetradactylous.

SPECIFIC CHARACTER, &c.

White JABIRU, with the head and neck green-black; the coverts, scapulars, and tail black; the bill black, and the legs red.

New Holland JABIRU.

Lin. Trans. Vol. 5. p. 34.

The common or American Jabiru has long since been known to naturalists, and is found in many parts of South America. The present species is a native of Australasia, or New Holland, and differs very strikingly from the American bird in the appearance of the head and neck, which, instead of being bare, are entirely covered with feathers of a most elegant dark green, similar to those of a mallard, and accompanied by an elegant blue or purple

changeable lustre. The bill is black, and beneath the lower mandible, to some little distance down the throat, is an extensile naked skin or sacculus of a bright red colour: the rest of the bird is of a snowy whiteness, the coverts of the wings, and the tail excepted, which are jet-black: the legs and feet are of a bright red. According to some very accurate drawings, in the collection of Mr. White, Chief Surgeon to the Settlement at Botany Bay, this species, when full-grown, must be equal in size to the common Jabiru, being not less than six or seven feet high. The present specimen, however, which is preserved in the Leverian Museum, falls short of the height just mentioned, scarcely exceeding that of four and a half, or five feet.

ARANEA TARANTULA.

CHARACTER GENERICUS.

Pedes octo.

Oculi octo.

Os unguibus seu retinaculis duobus.

Palpi duo articulati; masculis genitalibus capitati.

Anus papillis textoriis.

Lin. Syst. Nat. p. 1030.

CHARACTER SPECIFICUS, &c.

ARANEA fusca, abdomine supra maculis triangularibus nigris margine albidis, pedibus nigro variatis.

ARANEA TARANTULA. A. subtus atra, pedibus atro-fasciatis.

Lin. Syst. Nat. p. 1035.

Araneam Tarantulum, de qua abunde fabularum nugarumque laboriose doctarum audivimus, quæque ad hunc usque diem vulgi fidem et ignorantiam exercet, generant, calidiores Italiæ regiones, aliæque nonnullæ partes Europæ, arva amantem, ut plurimum,

mum, sicca et soli exposita. Magnitudo et colores accurate in tabula exprimuntur. In ævo, cui plenum scientiæ lumen affulsit, satis sit notare ficta et inania haberi quæ de symptomatibus morsum Tarantulæ sequentibus, non nisi musica tollendis decantari solita sunt, et apud sanos omnes totam fabulam exolevisse.

THE TARANTULA.

GENERIC CHARACTER.

Legs eight.

Eyes eight.

Mouth furnished with two hooks or holders.

Palpi or *Feelers* two, the tips of which (in the males) distinguish the sex.

Abdomen terminated by papillæ or teats, thro' which the insect draws its thread.

SPECIFIC CHARACTER, &c.

Brown Spider, with the back of the abdomen marked by trigonal black spots with whitish edges, and the legs variegated with black.

The TARANTULA Spider.

The Tarantula, of which so many idle recitals have been detailed in the works of the learned, and which even to this day continues to exercise the faith and ignorance of the vulgar, is a native of the warmer parts of Italy, and some other European regions, and is generally found in dry and sunny plains.

plains. Its size and colours are accurately represented on the annexed plate. In the present illuminated period, it may be sufficient merely to add, that the extraordinary symptoms supposed to ensue from its bite, as well as their supposed cure by the power of musick alone, are entirely fabulous, and are now sufficiently exploded among all rational philosophers.

VESPA CAMPANARIA.

CHARACTER GENERICUS.

Os corneum; maxilla compressa. Palpi quatuor inæquales, filiformes.

Antennæ filiformes; articulo primo longiore cylindrico.

Oculi lunares.

Corpus glabrum.

Aculeus punctorius reconditus. *Alæ* superiores plicatæ.

CHARACTER SPECIFICUS, &c.

VESPA Holsatica. V. nigra, linea utrinque ad humeros, maculisque scutellaribus luteis, abdomine luteo segmentis basi transverse punctisque contiguis nigris.

Latreille. Ann. du Museum d'Histoire Naturelle, p. 287.

Insectorum in nidificando æque ac avium ingeniosa est solertia, et fortasse magis varia, illorum præcipue quæ *Hymenoptera* et *Neuroptera* dicuntur; aliorum rarior longe, at non minus miranda. Ingens species aranearum Americanarum nidum struit calido artificio

ficio cylindraceum et tubulatum, cujus introitum, ut minus suspecta lateat, valvis mobilibus occludit, prædam si quam appropinquantem viderit, exiliendo arreptura. Nota est Myrmeleonis Formicaleonis Linnæi astutia, qui dum adhuc larva est, in arena cubans suo ipsius labore profunde et orbiculatim excavata, insectis quæ forte juxta repentina deciderint, vigilantissime insidiatur. Termitum quos parit Asia et Africa mirandum est ingenium, qui nidos ædificant in altitudinem multorum pedum, concameratos, et in magnam cellarum varietatem divisos. At longe præ aliis omnibus dædalis apum vesparumque laboribus maximus semper habitus est honos; e quibus nulla elegantius nidificat quam species reliquis minus nota, quod cubile sibi faciat in locis solitariis, in summis scilicet stabulis, aliisque id generis. Struit hæc nidum insignem festucæ, ut plurimum, seu frustulo ligni, aut tali alicui affixum, pendentemque de culmine horrei, aut septi cujuslibet, ore deorsum spectante, constantemque e globis concentricis tribus, quatuor, et interdum pluribus, substantiæ fere ejusdem ac papyri rudioris, imo modice aperto rotundoque. In medio globi interioris construitur cellularum congeries, duodecim scilicet seu quindecim, seu etiam viginti, quasi papyriarum, more ipsius nidi, et circa columnam centralem dispositarum. Cæteris paulo humilior est circulus cellularum exterior. Reperitur nidus fere exeunte æstate. Quod impossibile sit internam nidi conformationem plene repræsentare, ni execta sit pars aliqua ut inspiciantur cellulæ, ideo in tabula duæ proponuntur figuræ, quarum una nidum externum ostendit; altera per

per globos omnes concentricos nidum totum aperit sectione recta longitudinali.

Notandum porro est Vespam quandam Americanam nidum formare eodem omnino modo quo hæc nostra ; longe autem majorem, et e numerosioribus globis concentricis constantem, duodecim scilicet seu pluribus ; suspensum, ut plurimum, ramulis arborum, pinorum nempe et aliarum ; seu potius iis affixum.

THE
CAMPANULAR WASP.

GENERIC CHARACTER.

Mouth horny ; with a compressed jaw : *Feelers*
four, unequal, filiform.

Antennæ filiform ; with the first joint longer
than the rest and cylindrical.

Eyes lunated.

Body smooth. *Sting* concealed. *Wings* pleated.

SPECIFIC CHARACTER, &c.

Black WASP, with a luteous line on each side
the thorax, two luteous spots on the scutel-
lum, and luteous abdomen with transverse
annular black bands accompanied by black
spots at their ends.

La Guepe de Holstein.

Latreille. Ann. d'Hist. Nat. p. 288.

The nidification of insects is scarcely less curious
than that of birds, and the variety of structure is even
greater. It is principally in the classes *Hymenoptera*
and

and *Neuroptera* that this practice prevails; in the other classes it is less general, though not less singular. Thus a large species of American spider forms a very curious tubular or cylindrical nest in which it generally resides, and, in order to remove all suspicion of the dangerous inhabitant, it constantly forms a moveable valve or door, with which it closes the entrance, and when it perceives the approach of any other insect, springs out and seizes the prey.

The curious policy of the Myrmecoleon Formicaleo in its larva state is well known. It lies in ambush at the bottom of a deep conical cavity formed in dry sand, into which other insects accidentally falling are sure of being seized by the watchful inhabitant.

The Termites of Africa and Asia afford wonderful examples of this nidificating power, and form stupendous structures of many feet in length, and divided into a vast variety of cells and passages. Of all insects however those whose operations are most conspicuous are the different kinds of Bees and Wasps, whose labours have been admired in all ages, and celebrated from the most remote antiquity. Amongst the most elegant of these structures may be numbered that of a species of Wasp, which, on account of its frequenting retired places, and fixing its nest in the upper parts of buildings, is less attended to than many others of its genus. The structure of the nest is singularly curious. It is commonly fastened or suspended by a straw, or slight fragment of wood, or other small projecting substance, from the upper part of some barn or outhouse, and consists of three or four, and sometimes more concentric globes,

globes, of an appearance resembling that of coarse paper, with a rather small round opening at the bottom. In the middle of the interior or central globe is placed the congeries of cells, to the number of twelve, fifteen, or even twenty : these are arranged round a kind of central column, and are composed of the same paper-like substance with rest of the nest ; the exterior circle of cells being somewhat lower or shorter than the rest. These curious nests are generally found about the latter end of summer. It being impossible to give a clear idea of the internal structure of the nest without laying it open, it is represented in two views on the annexed plate ; one of the figures shewing its complete exterior appearance ; the other being cut perpendicularly downwards in order to display the central cells.

It may not be improper to observe that there is an exotic species of Wasp, a native of America, which forms a nest on a plan exactly similar to our present species, but differing in being much larger, and having the concentric globes far more numerous, viz. from ten to twelve, or more. These American Wasp-nests are commonly suspended from, or rather affixed to the small branches of trees, as Firs, &c.

PAPILIO MEROPE.

CHARACTER GENERICUS.

Antennæ apicem versus crassiores, sæpius clavato-capitatae.

Alæ (sedentis) erectæ sursumque conniventes, (volatu-diurno.)

CHARACTER SPECIFICUS, &c.

PAPILIO alis flavis limbo nigro, posterioribus subtus fascia fusca.

PAPILIO Brutus.

Lin. Syst. Nat. Gmel. p. 2237.

PAPILIO MEROPE.

Cram. t. 378. f. D. E.

Africæ varias partes incolit Papilio Merope, cujus veram magnitudinem cernere est in tabula: coloribus interdum paulo variat.

MEROPE.

GENERIC CHARACTER.

Antennæ thickening towards the upper part, and generally terminating in a clavated tip.

Wings (when sitting) erect, and meeting upwards. (Flight diurnal.)

SPECIFIC CHARACTER, &c.

Butterfly with yellow wings bordered with black; the lower pair marked beneath by a transverse brown band.

P. MEROPE.

Cram. t. 378. f. D. E.

This species is a native of several parts of Africa, and is represented on the plate in its natural size. In colour it sometimes varies a little.

ANAS ÆGYPTIACA.

CHARACTER GENERICUS.

Rostrum lamelloso-dentatum, convexum, obtusum.

Lingua ciliata, obtusa.

Lin. Syst. Nat. p. 194.

CHARACTER SPECIFICUS, &c.

ANAS flavo-ferruginea, fusco-undulata, speculo alari candido, fascia nigra.

ANAS ÆGYPTIACA. A. rostro subcylindrico, corpore undulato, vertice albo, speculo alari albo fascia nigra.

Lin. Syst. Nat. p. 197.

Elegantem hanc speciem, in variis Africanis partibus generatam, abundantius alere dicitur Ægyptus. In Angliam jam olim illata est; commendatque eam tam venustas quam cicur et mansuetum ingenium. In avium numero est quarum imaginibus adornare soliti sunt antiqui Ægyptii sacras sculpturas; in obeliscis nonnullis præcipue notabilis, quos, inter alia vetera monumenta in Museo Britannico jam asservatos, a Gallis nuperrime eripuerunt celeberrimi nostri bellici ductores qui in Ægypto militarunt.

Magnitudo avis eadem fere est atque anseris communis.

THE
EGYPTIAN GOOSE.

GENERIC CHARACTER.

Bill broad and flattened; the edges marked with sharp lamellæ.

Tongue broad and ciliated at the edges.

SPECIFIC CHARACTER, &c.

Yellowish-ferruginous GOOSE, with brown undulations, and white wing-coverts crossed by a black bar.

EGYPTIAN GOOSE.

Lath. syn. 3. p. 453.

L'Oye d'Egypte.

Buff. 9. p. 79.

Pl. Enl. 379. 982. 983.

This elegant species is found in several parts of Africa, and is said to be particularly plentiful in Egypt. In our own country it is often seen in a domestic state, and is highly esteemed on account of its agreeable appearance. It is one of those birds

which were frequently represented among the sacred sculptures of the ancient Egyptians, and is particularly observable on some obelisks lately brought from Egypt by our celebrated countrymen, and now deposited in the British Museum.

PATELLA FUSCA.

CHARACTER GENERICUS.

Animal Limax.

Testa univalvis, subconica, absque spira.

Lin. Syst. Nat. p. 1257.

CHARACTER SPECIFICUS, &c.

PATELLA testa subintegra ovata obtusa fusca,
elevato-striata, intus alba.

PATELLA FUSCA. P. testa integerrima ovata,
obtusa, striis elevatis.

Lin. Syst. Nat.

Maria Indica et Americana incolit Patella fusca,
magnitudine vera in tabula depicta.

THE
BROWN PATELLA.

GENERIC CHARACTER.

Animal allied to a Limax or Slug.

Shell univalve, 'subconic, without spire.

SPECIFIC CHARACTER, &c.

PATELLA with nearly entire, ovate, brown,
ribbed Shell, white within.

The brown Indian Limpet.

The Brown Patella is a native of the Indian and American seas, and is represented on the plate in its natural size.

MADREPORA PEZIZOIDES.

CHARACTER GENERICUS.

Animal Medusa.

Corallium cavitatibus lamelloso-stellatis.

CHARACTER SPECIFICUS, &c.

MADREPORA subcærulea subfoliacea concava,
supra stellis muricata, subtus aceroso-scabra.

MADREPORA cinerascens. M. subfoliacea
explanata aggregata, subtus aceroso-sca-
brosa, stellis remotiusculis elevatis, ambu-
lacrīs scabrosis.

Soland. et Ellis Zooph. p. 157. t. 43.

E maribus Indicis extrahitur rara hæc Madrepora,
interdum multo major quam in tabula depingitur.

THE
PEZIZOID MADREPORE.

GENERIC CHARACTER.

Animal allied to a Medusa.

Coral marked by lamellar star-shaped cavities.

SPECIFIC CHARACTER.

Blueish subfoliaceous concave MADREPORE,
muricated above with star-shaped pores,
and of a chaffy-rough surface beneath.

This rare species of Madreporé is found in the Indian seas, and is sometimes much larger than the specimen figured on the present plate.

PHALANGIUM DUBIUM.

CHARACTER GENERICUS.

Pedes octo.

Oculi verticis duo contigui, duo laterales.

Frons antennis pediformibus.

Abdomen rotundatum.

Lin. Syst. Nat. p. 1028.

CHARACTER SPECIFICUS.

PHALANGIUM fuscum, chelis minutis dorsalibus.

In litoribus Americanis? generatur Phalangium dubium. A Domino Latham nacti sumus specimen quod depinximus. Ignotum credimus fuisse ipsum insectum, nec ab aliquo antea depictum.

THE
DOUBTFUL PHALANGIUM.

GENERIC CHARACTER.

Legs eight.

Eyes two vertical and two lateral.

Antennæ resembling legs.

Abdomen rounded.

SPECIFIC CHARACTER.

Brown PHALANGIUM, with minute dorsal
claspers.

This species is supposed to be a native of some of the American coasts. The specimen figured on the annexed plate was communicated by Mr. Latham. It is an insect which seems not to have been hitherto described or figured.

PSITTACUS AUGUSTUS.

CHARACTER GENERICUS.

Rostrum aduncum ; mandibula superiore mobili ; cera instructum.

Nares in rostri basi.

Lingua carnosae, obtusa, integra.

Pedes scansorii.

Lin. Syst. Nat. p. 139.

CHARACTER SPECIFICUS, &c.

PSITTACUS macrourus cyaneus, rostro pedibusque nigris ; orbitis basique mandibulae inferioris luteis.

Museum Leverianum. No. 2. t. 2.

PSITTACUS hyacinthinus.

Lath. ind. orn. p. 84.

In Musco Leveriano asservatur avis hæc rarissima, quæ reliquis fere omnibus psittacini generis mole et magnificentia antecellere videtur. Tota avis est eximie cyanea, nisi quod super frontem et margines remigum levissima sit coloris thalassini tinctura. Superficies inferior alarum caudæque ni-

gra est. Rostrum præter solitum magnum validum-
que omnino nigerrimum. Nigrant quoque crura et
pedes, quorum ingens est robur. Orbitæ seu spatia
nuda circum oculos coloris sunt lutei: lutea est
etiam cutis nuda qua mandibulæ inferioris basis cin-
gitur. Partium corporis proportio eadem fere est
cum Psittaco Ararauna. In iisdem quoque Americæ
Australis partibus fortasse generatur. Præter speci-
men quod descripsimus vix aliud in tota Europa
inveniri dicitur.

Feet scansorial.

Long-tailed deep-blue MACCAW, with the bill and legs black ; the orbits and base of the lower mandible yellow.

Lath. ind. orn. p. 84.

surface

surface of the wings and tail is black. The beak, which is uncommonly large and strong, is of a deep black, as are also the legs and feet, which are extremely stout. The orbits or naked spaces round the eyes are of a deep yellow, as is also the skin round the base of the lower mandible. The general proportions of the bird are nearly the same as those of the *Psittacus Ararauna*, and it is probably a native of the same parts of South America. The specimen now described is perhaps the only one known to exist at present in Europe.

OVIS CANADENSIS.

CHARACTER GENERICUS.

Cornua concava, retrorsum versa, intorta, rugosa.

Dentes primores inferiores octo.

Laniarii nulli.

CHARACTER SPECIFICUS, &c.

OVIS pilosa fusco-ferruginea, fronte uropygioque albis, cauda brevissima, cornibus compressis lunatis.

Belier de Montagne.

Geoffr. Ann. Mus. Nat. No. 11. p. 360.

Physicis Europæis non nisi nuperrime innotuisse videtur Ovis quam describere pergitur, in Canada interiori generata, nec lana vestita, sed pilo denso, valido, et quasi cervino. Crura, si cum corpore comparentur, longa et gracilia. Cornua iis simillima quæ gerit aries nostras vulgaris: at fœminæ minora longe quam mari. Color generalis fusco-ferrugineo-pallet, idem fere ac cernere est in multis cervini generis. Genæ obscuriores. Rostrum et uropygium alba. Cauda brevissima. Idem fere dicitur esse huic vivendi modus qui Ibici; scandenti nempe montium cacumina, et mira celeritate de rupe

rupe in rupem salienti. Ovium hujusmodi congregantur, ut plurimum, viginti seu triginta ; vocantque eas Canadenses *oves rupestres*. Juniorum caro in cibis lautissimis habetur. Ovi Canadensi eadem fere est magnitudo atque Ibici. Perpulchrum rari hujus quadrupedis specimen in Museo Britannico conspicitur.

THE
CANADIAN SHEEP.

GENERIC CHARACTER.

Horns hollow, wrinkled, turning backwards,
and spirally intorted.

Front-Teeth eight in the lower jaw.

Canine-Teeth none.

SPECIFIC CHARACTER, &c.

Ferruginous-brown hairy SHEEP, with white
front and rump, very short tail, and com-
pressed lunated horns.

Belier de Montagne.

Geoffr. ann. mus. nat. No. 11. p. 360.

The species of sheep here represented, and which appears to have been, till very lately, unknown to the naturalists of Europe, is a native of the interior parts of Canada. It is remarkable for being covered, instead of wool, with very thick and strong hair, greatly resembling that of a Deer. The legs are long in proportion to the body. The horns very much resemble

seem those of the common ram, and those of the female are said to be much smaller than those of the male. The general colour is a pale ferruginous brown, similar to that of many of the Deer tribe: the cheeks are of a darker cast than the other parts, and the muzzle and rump are white: the tail is very short. The general habits of the animal are said to resemble those of the Ibex, frequenting chiefly the highest and most inaccessible parts of the mountainous regions, occasionally skipping from rock to rock with incredible swiftness. It is generally observed in small flocks of twenty or thirty together, and is known to the Canadians by the name of *Mountain Sheep*. The young are considered as the most delicate meat which that extensive country can afford. A very fine specimen of this rare quadruped may be seen in the British Museum.

PHALÆNA REGIA.

CHARACTER GENERICUS.

Antennæ setacæ, a basi ad apicem sensim attenuatæ.

Alæ sedentis sæpius deflexæ. (*Volatu* nocturno.)

Lin. Syst. Nat. p. 808.

CHARACTER SPECIFICUS, &c.

PHALÆNA (Bombyx) elinguis, alis deflexis griseo-fuscis flavo maculatis fulvoque nervosis ; posticis corporeque fulvis.

Smith. Abbot. Ins. Amer. p. 121. t. 61.

Bombyx regalis.

Fabr. ins. emend. vol. 4. p. 436.

PHALÆNA Laocoon.

Cram. pap. t. 117. B. C.?

Quamvis erucam seu larvam pulcherrimi hujus insecti satis accurate delineaverunt Catesbeius alii-que, ipsam tamen phalænam primo depictam esse arbitror in Crameri pagina. Quod autem animalculi omnes permutationes subeuntis plena ad nos notitia pervenerit, debetur laudabili industriæ Domini Abboti, qui opus nuperrime edidit insoliti splendoris
de

de insectis Transatlanticis, doctis præterea ditatum observationibus Domini Smithii, M. D. Societatis Linnæanæ Londinensis præsidis. Docet Dominus Abbotus, crucam, (nomine *diaboli cornuti* vulgo dictam) folia Diospyri Virginianæ et Juglandis albæ præcipue depascere, et tela tenui involutam in chrysalidem converti mense Junio, mense autem Julio erumpere phalænam.

Notavit recte omnino Dominus Smithius phalænam hanc phalænæ nostræ Europææ *Ph: Humuli* Linnæi (Ghost-Moth) habitu generali evidenter esse affinem.

Variæ insecti vices ostenduntur in tabula juxta naturalem magnitudinem.

THE
PERSIMON MOTH.

GENERIC CHARACTER.

Antennæ setaceous, decreasing in size from base to point.

Wings (when at rest) generally deflected. *Flight* chiefly nocturnal.

SPECIFIC CHARACTER, &c.

MOTH with deflected grey-brown wings, with yellow spots and fulvous nerves : the lower wings and body fulvous.

The PERSIMON MOTH.

Abbot's American Insects. p. 121. pl. 61.

The caterpillar of this highly-elegant insect has long ago been figured with sufficient accuracy by Catesby and others, but the Moth seems to have been first figured in the work of Cramer. For the complete knowledge of the insect in all its states we are indebted to the laudable industry of Mr. Abbot, whose researches on the Transatlantic Insects, assisted by the learned and accurate annotations of Dr. Smith, president of the Linnæan Society of

of London, have lately appeared with such superior splendour. Mr. Abbot informs us that the caterpillar (which is popularly known by the title of the Horned Devil) feeds principally on the leaves of the Persimon and the Hicory, and that it changes into a chrysalis in the month of June, (first enveloping itself in an oval web,) the moth appearing in the month of July. Dr. Smith, in his annotations, has very judiciously added, that in point of general habit this moth is evidently allied to the European species called the Ghost-Moth (*Phalæna Humuli* Lin.) The plate represents the animal in its several changes, and in its natural size.

MEROPS CÆRULOCEPHALUS.

CHARACTER GENERICUS.

Rostrum compressum, curvatum, carinatum.

Lingua apice laciniata.

Pedes gressorii.

Lin. Syst. Nat. p. 182.

CHARACTER SPECIFICUS, &c.

MEROPS RUBER, capite gula uropygioque
cæruleo-viridibus.

MEROPS NUBICUS. M. ex cæruleo viridis
subtus ruber, dorso, alis, caudaque fureata
lateritiis.

Lin. Syst. Nat. Gmel. p. 464.

Africæ partes interiores incolit *Merops Cæruleocephalus*: magnitudo avis eadem fere est atque *Meropis* communis sive Europææ. Variat cauda sub-integra vel forcipata.

THE
BLUE-HEADED BEE-EATER.

GENERIC CHARACTER.

Bill compressed, curvated, and carinated.

Tongue generally laciniated at the tip.

Feet formed for walking.

SPECIFIC CHARACTER, &c.

RED BEE-EATER, with the head, throat, and
rump blue-green.

BLUE-HEADED BEE-EATER.

Lath. Syn. 1. p. 680.

Le Gnépier rouge à tete bleue.

Buf. ois. 6. p. 506.

Gnépier de Nubie.

Pl. Ent. 649.

This bird is a native of the interior parts of Africa, and is nearly similar in size to the common or European Bee-Eater. It varies in having the tail either even or slightly forked.

ARANEA VENATORIA.

CHARACTER GENERICUS.

Pedes octo.

Oculi octo.

Os unguibus seu retinaculis duobus.

Palpi duo articulati ; masculis genitalibus capitati.

Anus papillis textoriis.

Lin. Syst. Nat. p. 1030.

CHARACTER SPECIFICUS, &c.

ARANEA CASTANEA, thorace glabro, abdomine pubescente fusco.

ARANEA VENATORIA. A. thorace orbiculato glabro atro, abdomine ovato pubescente fusco.

Lin. Syst. Nat. Gmel. p. 2960.

Fabr. sp. ins. 1. p. 546.

Jamaicam insulasque alias Americanas incolit Aranea venatoria, in locis siccis et arenosis nidum struens cylindraceum, quinque vel sex uncias longum, et operculo seu valvula instructum, quæ ad libitum resilit et clauditur. In hoc latibulo prædæ insidiatur, insectis nempe prope repentibus aut volantibus, quæ saltu subito arrepta et in nidum subducta, clauso operculo, devorat. Ostenditur in tabula animalis vera magnitudo ; nidus autem magnitudine diminuta conspicitur.

614

THE
AMERICAN TARANTULA.

GENERIC CHARACTER.

Legs eight.

Eyes eight.

Mouth furnished with two hooks or holders.

Palpi or *Feelers* two, the tips of which (in the males) distinguish the sex.

Abdomen terminated by papillæ or teats thro' which the insect draws its thread.

SPECIFIC CHARACTER, &c.

CHESNUT SPIDER, with smooth thorax, and brown pubescent body.

BLACK TARANTULA. *Brown's Jamaica.*

AMERICAN TARANTULA.

The *Aranea venatoria* inhabits Jamaica, and other American islands: it constructs in dry and sandy situations a cylindrical nest of five or six inches in length, furnished with an elastic closing valve. In this nest the animal waits the arrival of its prey, viz. any insect flying or creeping near; and suddenly rushing out, secures its victim, which it drags into the nest, and devours at leisure, the valve immediately closing behind it. In the annexed plate the spider itself is represented in its natural size; the nest of half its real dimensions.

PHALÆNA CECROPIA.

CHARACTER GENERICUS.

Antennæ setaceæ, a basi ad apicem sensim attenuatæ.

Alæ sedentis sæpius deflexæ. (Volatu nocturno).

Lin. Syst. Nat. p. 808.

CHARACTER SPECIFICUS, &c.

PHALÆNA alis subfalcato-rotundatis griseofuscis, fascia ferruginea maculaque media fenestrata.

PHALÆNA CECROPIA. P. alis subfalcatis griseis, fascia fulva, primoribus ocello subfenestrato ferrugineo.

Lin. Syst. Gmel. p. 2401.

Catesb. Carol. 2. t. 86.

Cram. pap. 4. t. 42. f. A. B.

In variis Americæ borealis partibus conspicitur pulcherrima hæc Phalæna. Operi splendidissimo Domini Abboti de insectis Americanis effigiem debemus larvæ et pupæ.

CECROPIAN MOTH.

GENERIC CHARACTER.

Antennæ setaceous, decreasing in size from base to point.

Wings (when at rest) generally deflected.
Flight nocturnal.

SPECIFIC CHARACTER, &c.

GREY-BROWN MOTH, with rounded sub-falcated wings, marked by a ferruginous band and semitransparent middle spot.

Seb. Mus. 4. *t.* 58. *f.* 4. 5 ?

Drury. 1. *pl.* 18. *f.* 2.

This highly beautiful insect is found in many parts of North America. It is to the splendid publication of Mr. Abbot on the American insects that we are indebted for the figure of the larva and pupa.

TURDUS CYANURUS.

CHARACTER GENERICUS.

Rostrum tereti-cultratum, mandibula superiore apice deflexo, emarginato.

Nares nudæ, superne membranula semitectæ.

Faux ciliata.

Lingua lacero-emarginata.

Lin. Syst. Nat. p. 291.

CHARACTER SPECIFICUS, &c.

TURDUS SUBFERRUGINEUS subtus flavus, abdomine cærulco lineato, cauda cyanea.

TURDUS CYANURUS. T. rufo-fuscus, subtus flavus, abdomine cærulco fasciato, pileo lateribusque colli striga longitudinali nigra, fascia pectorali caudaque cæruleis.

Lath. ind. orn. p. 361.

In avibus quas plurimas alit America australis, haud facile elegantiores reperies Turdo cyano. Caput fasciis nigris flavisque lateralibus decoratur :

II

dorsum

dorsum humerique nitidissime castanea : alarum remiges nigri ; cœticum apicibus albis fasciam concolorem per medium quasi alæ ducentibus. Tota avis inferior a gula pulchre flavet, lineis plurimis transversis læte cœruleis variata. Cauda brevis et acutula splendidissime cyanea est, pennis lateralibus a mediis duabus gradatim utrinque decrescentibus. Rostrum nigrum, pedes fusi. Avem hanc raritate mirabilem jactant perpauca musea. In Cayenna præcipue generari dicitur *Turdus cyanurus*.

BLUE-TAILED THRUSH.

GENERIC CHARACTER.

Bill strait, obtusely carinated at the top, bending a little at the point, and slightly notched near the end of the upper mandible.

Nostrils oval and naked.

Tongue slightly jagged at the end.

Middle-toe slightly connected to the outer as far as the first joint.

SPECIFIC CHARACTER, &c.

SUBFERRUGINOUS THRUSH, yellow beneath, with deep blue tail, and abdomen marked by numerous blue lines.

L'Azurin. *Buff. ois.* 3. p. 410.

Merle de la Guiane. *Pl. Enl.* 355.

The Blue-Tailed Thrush may be considered as one of the most elegant of the South-American birds.

birds. The head is ornamented on each side by black and yellow stripes: the back and shoulders are of a bright chesnut colour: the wing-feathers black: the coverts tipped with white, forming a band of that colour across the middle of each wing: the whole under part of the bird, from the throat, is of a bright yellow, marked with numerous bright-blue transverse lines: the tail is short, and of a slightly sharpened shape, the feathers gradually shortening on each side from the middle ones: the bill is black and the legs brown. This highly rare and beautiful bird is but rarely seen in European museums, and is principally found in Cayenne.

PHALÆNA STRIX.

CHARACTER GENERICUS.

Antennæ setaceæ, a basi ad apicem sensim attenuatæ.

Alæ (sedentis) sæpius deflexæ. (Volatu nocturno.)

Lin. Syst. Nat. p. 808.

CHARACTER SPECIFICUS, &c.

PHALÆNA ALBIDA, alis concoloribus fusco nigroque reticulatis nebulosisque

WHITE-EYED COWRY: *Sulciatraginus*
Cowry, with white, eye-shaped spots.

Le Vein-Argus. *Deville.*

Le véritable Argus. *Knorr.* vergn. 2. t. 14, f. 2.

These rare and beautiful shells are chiefly found
in the Indian seas, and are sometimes seen of a
larger size than represented on the present plate.

ASTERIAS OLIGACTES.

CHARACTER GENERICUS.

Corpus depressum; crusta coriacea, tentaculis muricata.

Os centrale, quinquevalve.

Lyn. Syst. Nat. p. 1098.

CHARACTER SPECIFICUS, &c.

ASTERIAS ALBO-FLAVESCENS, radiis longissimis simplicibus.

ASTERIAS OLIGACTES. A. radiis longissimis simplicibus; articulis singulis basi stylis binis mobilibus acutis.

Lin. Syst. Nat. GMEL. p. 3167.

Pall. nov. act. Petrop. 2. p. 239.

A celeberrimo Pallas in Novis Actis Academiae Petropolitanae ita describitur *Asterias oligactes*.

“Corpusculum duriusculum, exiguum, magnitudine ea quam figura exprimit, pentagonum, angulis truncatis; superiore facie medio impressa, stellataque costis rotundatis denis, per paria versus angulos truncatos subparallelis, extrorsum crassescens; inferiore

inferiore facie plana, ore in medio ramis linearibus
discisso, stellato et ad ortum radiorum fissura utrin-
que obliqua incisa. Radii proportionē corporis
enormi longitudine ad quindecim pollices et ultra
explere visi, quantum mensurare filo potuere, tereti-
filiformes, lentissime adtenuati, compositi articulis
creberrimis, crustaceis, osseis, consistentia et colore
ut in *Asteria Medusæ*. Singuli articuli ad latus ori
respondens instructi pedunculis seu stylis binis mobi-
libus, ipso articulo vix longioribus, approximatis.
Color totius albo-flavescens, consistentia dura,
crustacea.”

tral, star-shaped and divided by linear processes: the rays or limbs are of enormous length in proportion to the body, measuring more than fifteen inches, and are of a rounded, thread-like appearance, tapering very gradually to their extremities, and consist of very numerous, crustaceous or bony joints, of similar consistence to those of the *Asterias Medusa*: each joint, on the side or surface answering to the mouth, is furnished with two moveable styles or processes, scarce longer than the joint itself: the whole animal is of a yellowish white colour, and of a hard, crustaceous substance.

ARDEA TIGRINA.

CHARACTER GENERICUS.

Rostrum rectum, longum, acutum.

Nares lineares.

Lingua acuminata.

Pedes tetradactyli.

CHARACTER SPECIFICUS, &c.

ARDEA ferruginea, fasciis transversis nigris.

ARDEA tigrina. A. capitis laevis vertice, caudaque albo-fasciata nigris, corpore nigro-maculato supra rufo subtus ochroleuco, mento et crisso albis.

Lin. Syst. Nat. Gmel. p. 638.

ARDEA TIGRINA. A. maculis nigris difformibus notata, supra rufa subtus albida, vertice caudaque nigris, rectricibus fasciis quatuor albis.

Lath. ind. orn. p. 682.

Partes Americæ Australis calidiores incolit Ardea
1 tigrina,

tigrina, loca paludosa amans, moreque congenerum
pisciculis, ranis, aliisque ejusmodi victitans: magni-
tudine Ardeam stellarem fere æquat.

❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖ ❖

Feet tetradactylous.

Ferruginous BITTERN, with transverse black bands.

Lath. syn. 3. p. 63.

Fermin Surin. 2. p. 151.

Buff. ois. 7. p. 431.

Pl. Ent. 790.

The Tiger Bittern is a native of the warmer regions of South-America, frequenting marshy places, and preying

preying, like the rest of this genus, on small fishes,
frogs, &c. In size it nearly equals the common
Buttern.

SOLPUGA VENENOSA.

CHARACTER GENERICUS.

Mandibulæ maximæ, porrectæ, forcipatæ.

Labium inferius porrectum, subulatum.

Palpi elongati, pedibus anterioribus basi connexi.

CHARACTER SPECIFICUS, &c.

SOLPUGA tomentosa fusca, corpore ovato.

SOLPUGA arachnodes.

Herbst. apt. p. 37. t. 1. f. 2.

SOLPUGA araneoides.

Fabr. suppl. entom. p. 294.

Phalangium araneoides.

Pall. sp. zool. 9. p. 37. t. 3. f. 8. 9.

In genere *Solpuga*, cui cum Phalangio et Aranea multa videtur esse affinitas, continentur plures species. Harum fortasse princeps haberi possit, cujus veram magnitudinem cernere est in tabula. Generant eam Europæ Australis Africæque loca calidiora.

In

In agris versatur, morsuque cutem irritando, tumores excitare solet acerbe molestos. interdum lethales. A celeberrimo Herbstio in opere suo præstanti de insectis *apteris* primo institutum est genus *Solpuga*.

Feelers elongated, connected at their base with the fore-legs.

Brown, downy SOLPUGA, with ovate abdomen.

Galeode arancoide.

Olivier Nouveau Dict. D'Histoire Naturelle.

Sonnini Voy. en Grece. 2. p. 115.

The genus *Solpuga*, much allied to those of *Phalangium* and *Aranea*, contains several species, of which that represented in its natural size on the plate may perhaps be considered as the principal. It is a native of the warmer parts of the South of Europe, and of Africa, inhabiting fields, and by its bite producing most painful swellings on the skin,

and even, as it is said, sometimes proving fatal. The genus Solpuga seems to have been first instituted by Mr. Herbst, in his excellent work on the Apterous Insects.

MADREPORA PILEUS.

CHARACTER GENERICUS.

Animal Medusa.

Corallium cavitatibus lamelloso-stellatis.

Lin. Syst. Nat.

CHARACTER SPECIFICUS, &c.

MADREPORA ovato-elongata albida, sulco longitudinali medio.

MADREPORA PILEUS. M. simplex acaulis oblonga, stella convexa conglomerato-lamellosa, lamellis abbreviatis, subtus concava.

Lyn. Syst. Nat. p. 1273.

Mitra Neptuni.

Tournef. act. Paris. 1700. p. 30.

Pileus Neptuni.

Seb. mus. 3. t. 111. f. 3. 5.

In oceano Indico reperta, quam descripsimus, Madrepora, major saepe est icone quæ ostenditur in tabula. Color albo-flavescit.

OBLONG MADREPORE.

GENERIC CHARACTER.

Animal allied to a Medusa.

Coral marked by radiating lamellar cavities.

SPECIFIC CHARACTER, &c.

Oblong whitish MADREPORE, with a longitudinal central furrow.

Mitra Polonica.

Rumph. Amb. 6. p. 248.

Oblong white MADREPORE.

The Madrepore figured on the present plate is a native of the Indian seas, and is frequently found much larger than here represented: its colour is yellowish white.

ERPETON TENTACULATUS.

CHARACTER GENERICUS.

Corpus caudaque squamosa.

Abdomen scutatum.

CHARACTER SPECIFICUS, &c.

ERPETON rostro utrinque tentaculato.

ERPETON TENTACULATUS. *Cepede.*

Ab illustri Cepede institutum genus Erpeton ex unica constat specie quæ insulas Indicas creditur incolere, quamque insigniunt tentacula duo, seu quasi cornua, super labium superius sita, parvulis squamis vestita, nec unquam retracta. Bipedali quasi longitudine est Erpeton tentaculatus, veneni expertus, dentes habens minimos, eodem modo dispositos quo dentes serpentum innocuorum. Cuinam vivendi modo se præcipue assuescat, non satis est compertum.

Specimen quod descripsit Cepede in museo Principis Aransiaci asservatur.

TENTACULATED ERPETON.

GENERIC CHARACTER.

Body and tail scaly.

Abdomen lamellated.

SPECIFIC CHARACTER, &c.

ERPETON with the upper lip tentaculated on each side.

ERPETON tentaculé.

Cepede Ann. Mus. National D'Hist. Nat.

No. 10. p. 280. pl. 1.

The genus *Erpeton*, instituted by the Count de Cope, consists at present of a single species, which is supposed to be a native of the Indian islands, and is remarkable for a pair of tentacula or elongated processes situated above the upper lip: these tentacula are covered with very minute scales, and are not retractile. The animal measures about two feet in length, and is not of a poisonous nature, the teeth, which are very small, resembling those of innoxious serpents. Of its particular habits or history nothing seems to be known.

The specimen described by Cope belonged to the Museum of the Prince of Orange.

PARADISEA MAGNIFICA.

CHARACTER GENERICUS.

Rostrum capistri plumis tomentosis tectum.

Pennæ hypochondriorum longiores (plerisque.)

Rectrices duæ superiores singulares denudatæ.

CHARACTER SPECIFICUS, &c.

PARADISEA rufo-castanea, subtus viridi-nitens, collo utrinque pennis flavis fasciculato.

PARADISEA MAGNIFICA. P. supra spadicea, gula viridi lunulis aureis, cervicis fasciculo pennarum flavarum.

Lin. Syst. Nat. Gmel. p. 401.

Paradiseam magnificam commendat formæ elegantia et versicolor plumarum varietas. In insulis Moluccanis præcipue generatur, magnitudine Paradiseæ apodæ paulo inferior.

THE
MAGNIFICENT PARADISEA.

GENERIC CHARACTER.

Bill surrounded at the base by velvet-like feathers.

Hypochondrial feathers (in most species) long and loose.

Tail-feathers two upper naked or unwebbed.

SPECIFIC CHARACTER, &c.

RUFOUS-CHESNUT PARADISE-BIRD, luscid green beneath, with fasciculated yellow plumes on each side the neck.

MAGNIFICENT BIRD of PARADISE.

Lath. Syn. 1. p. 477.

Oiseau de Paradis, de la Nouvelle Guinée dit le Magnifique.

Pl. Enl. 631.

This elegant species, so remarkable for the splendor and variety of its colours, is principally found in the Molucca islands, and is of somewhat smaller size than the *Paradisæa apoda* or common Paradise-Bird.

SIMIA ASCANIUS.

CHARACTER GENERICUS.

Dentes primores utrinque quatuor, approxi-
mati.

Laniarii solitarii, longiores, hinc remoti.

Molares obtusi.

CHARACTER SPECIFICUS, &c.

SIMIA caudata, barbata, olivacea, subtus grisea,
facie violacea, naso albo.

SIMIA ASCANIUS. S. caudata barbata, facie
subcærulea, naso albo.

Audeb. Singes. fam. 4. sect. 2. f. 13.

Simiam *Ascanium* primus descripsisse videtur Do-
minus Audebertius, in eleganti opere, cui titulus
“*Histoire des Singes, &c.*” Eadem fere est magni-
tudine atque Simia Sabæa Linnæi, et indole esse
dicitur alacri, sed mansueta. De patria ambigitur;
Africanam tamen crediderim.

ASCANIUS.

GENERIC CHARACTER.

Front-teeth in each jaw four, placed near together.

Canine-teeth solitary, longer than the others, distant from the grinders.

Grinders obtuse.

SPECIFIC CHARACTER, &c.

Long-tailed, bearded, olive-coloured Monkey, grey beneath, with violaceous face, and white nose.

L'Ascagne.

Audeb. Singes.

The animal represented on the present plate seems to have been first described by Monsr. Audebert, in his elegant publication entitled "*Histoire des Singes*," &c. In size it nearly equals the *Simia Sabæa* or green monkey, and is said to be of a very lively, but gentle disposition. Its native country is not certainly known, but it is probably an African species.

ONISCUS ENTOMON.

CHARACTER GENERICUS.

Antennæ setaceæ.

Palpi inæquales, posteriores longiores.

Corpus ovale.

Pedes quatuordecim.

CHARACTER SPECIFICUS, &c.

ONISCUS antennis quaternis, cauda oblonga
acuta.

Fabr. spec. ins. 1. p. 375.

ONISCUS ENTOMON. O. abdomine subtus
nudo, cauda subulata.

Lin. Syst. Nat. p. 1060.

Marina hæc species, Oniscorum Britannicorum
maxima, adhæret plerumque piscibus majoribus.
Color viventi livido-fuscus, exsiccatae obscuro-al-
bidus.

THE
SHARP-TAILED ONISCUS.

GENERIC CHARACTER.

Antennæ setaceous.

Feelers unequal, the hinder longest.

Body oval.

Legs fourteen.

SPECIFIC CHARACTER, &c.

Pale brown ONISCUS, with four antennæ, and
oblong, sharpened tail.

SQUILLE ENTOMON.

Degeer. 7. p. 514.

This insect, the largest of the British Onisci, is a marine species, and is commonly found attached to the bodies of the larger fishes: its colour, when living, is pale brown, which fades in the dried animal into dull white.

CANCER LINEARIS.

CHARACTER GENERIC.

*Pedes octo, (rarius sex aut decem;) insuper
manus duæ chelatae.*

Oculi duo, distantes, plurimis pedunculati, elongati, mobiles.

Cauda articulata, inermis.

CHARACTER SPECIFICUS, &c.

CANCER corpore lineari, manibus monodactylis.

CANCER LINEARIS. Cancer manibus quatuor monodactylis, pedibus decem.

Fabr. sp. ins. 1. p. 517.

CANCER LINEARIS. *C. macrourus* articu-
laris, manibus quatuor monodactylis, pe-
dibus decem.

Lin. Syst. Nat. p. 1056.

Circa littora varia Europæa invenitur perpusilla hæc Cancri species. Magnitudine vera nec non microscopio aucta in tabula annexa exprimitur.

THE
LINEAR CRAB.

GENERIC CHARACTER.

Legs generally eight, (in some species six or ten,) besides two claspers or chelated arms.

Eyes two, commonly distant, footstalked, moveable.

Tail articulated.

SPECIFIC CHARACTER, &c.

LINEAR-BODIED CANCER, with monodactylous feet.

ONISCUS SCOLOPENDROIDES ?

Pall. sp. zool. q. t. 4. f. 15.

CHEVROLLE LINEAIRE,

Latreille.

This very small species of Crab is found about several of the European coasts. It is represented on the annexed plate both in its natural size, and as it appears when viewed by a microscope.

MUSCICAPA MELANOLEUCA.

CHARACTER GENERICUS.

Rostrum subtrigonum, utrinque emarginatum,
apice incurvo: *vibrissæ* patentès versus
fauces.

Nares subrotundæ.

Lin. Syst. Nat. p. 324.

CHARACTER SPECIFICUS, &c.

MUSCICAPA NIGRA, dorso albo, femoribus
albo nigroque annulatis, rectricibus albis
apice nigris.

Lath. ind. orn. p. 469.

MUSCICAPA MELANOLEUCA.

Guldenst. nov. comm. Petrop. t. 19. p. 468.

Primus accurate descripsit hanc speciem Dominus
Guldenstadt in Academiæ Petropolitanae Commen-
tariis.

“ Longitudo avis extensæ ab apice rostri ad
caudæ extremum sex pollicum, trium linearum:
capistrum, caput infra usque ad medium collum et

L

ad

ad latera usque ad supercilia atrum; sed caput supra et corpus totum niveum, pectore levissime flavescente; basi obtecta pennarum omnium fusca; alæ totæ supra infraque atræ, apicis margine remigum secundariarum obsolete albido; complicatæ ultra mediam caudam procedentes: cauda integra, duos pollices et sex lineas longa; rectrices duodecim, albæ, apice nigræ, eoque magis quo interiores, attamen nec in medio pari nigredo ad medietatem accedit: femora usque ad genu plumosa, fusco et albido annulata; tibiæ decem lineas longæ, atræ-leves; digiti pariter atrî, quarum tres antici, quartus posticus, omnes nigri, medio reliquis subæqualibus aliquantum longiore; ungues incurvi, acuti, nigri, subæquales. In femina ea quæ in mare nigra, fusca; et quæ in mare alba, sordide cinerea sunt. Habitat per æstatem in Georgia campestri ad fluviorum ripas fruticetis obsitas.

Wm. A. S. 1871

GEORGIAN FLYCATCHER.

GENERIC CHARACTER.

Bill somewhat triangular, flattened at the base, notched at the end of the upper mandible and beset with bristles.

Toes generally divided as far as their origin.

SPECIFIC CHARACTER, &c.

Black FLYCATCHER with white back, thighs annulated with black and white, and tail-feathers tipped with black.

Black-and-white WARBLER.

Lath. Syn. 2. p. 457.

The present species of *Muscicapa* seems to have been first accurately described in the Petersburg Transactions, by Mr. Guldensadt, who informs us that it measures six inches and three lines from the tip of the bill to the end of the tail: the frontlet and the head beneath, as far as the middle of the

1. 2

neck,

neck, and on each side as far as the eyebrows, is black ; but the upper part of the head, as well as the whole body, is white, with a very slight cast of yellow on the breast ; the covered parts or bases of all the feathers being brown : the whole wings, both above and beneath, are black, the edges of the tips of the secondary feathers whitish : the wings, when closed, reach beyond the middle of the tail, which is entire, and about two inches and six lines in length : the twelve tail-feathers are white : with black tips, that colour increasing gradually on the interior feathers ; but even in the two middle feathers not reaching half way up the tail : the thighs are feathered as far as the knees, and annulated with brown and whitish : the legs are ten lines long, smooth, and black, as are likewise the toes, of which the middlemost is rather longer than the rest ; the claws are curved, black, and of equal length. In the female all the parts which are black in the male are brown, and all the white parts are of a dull ash-colour. It is an inhabitant of Georgia during the summer, frequenting the shrubby banks of rivers.

SQUALUS TENTACULATUS.

CHARACTER GENERICUS.

Os in anteriore et inferiore capitis parte, dentibus numerosis seriatis.

Spiracula utrinque ad latera colli, plerisque quinque.

Corpus oblongum, teretiusculum.

CHARACTER SPECIFICUS, &c.

SQUALUS rostro utrinque tentaculato, spinoso, spinis longioribus brevioribusque intermediis.

PRISTIS cirratus. P. rostro cirrato, spinis longioribus ; brevioribusque intermediis.

Lath. Lin. Trans. 2. p. 281.

In maribus australibus reperitur rara hæc Squali species, longa forsan, cum plene adoleverit, multos pedes. Quæ tamen ab Australasie litoribus in Angliam delata fuerint specimina vix tres quatuorve pedes exuperant. Color totius animalis leviter fuscus, abdomine pallidiore.

THE
TENTACULATED SHARK.

GENERIC CHARACTER.

Mouth situated beneath the anterior part of the head, with numerous teeth disposed in rows.

Spiracles on each side the neck, in most species five in number.

Body oblong, somewhat cylindric.

SPECIFIC CHARACTER.

SHARK with serrated snout tentaculated on each side, with short teeth interposed between the longer ones.

The rare species of Shark here represented is a native of the Southern Seas, and probably measures several feet in length, when full grown; tho' the specimens which have been hitherto observed have scarcely exceeded three or four feet: the colour of the whole animal is pale brown, with the abdomen of a still paler cast.

MUREX BRANDARIS.

CHARACTER GENERICUS.

Animal Limax.

Testa univalvis, spiralis, exasperata suturis membranaceis.

Apertura desinens in canalem integrum rectum seu subadscendentem.

CHARACTER SPECIFICUS, &c.

MUREX testa subovata spinis rectis cincta, cauda mediocri subulata recta spinisque oblique circumdata.

Lin. Syst. Nat. p. 1214.

MUREX Purpura.

Rondel, test. 64.

E mari Mediterraneo præcipue extrahitur Murex Brandaris, magnitudine, spinis, coloribusque multum varians.

SNIPE MUREX.

GENERIC CHARACTER.

Animal allied to a Limax or Slug.

Shell univalve, spiral, roughened by membranaceous sutures.

Aperture ending in a strait subascending channel.

SPECIFIC CHARACTER, &c.

Subovate cinereous MUREX, with strait spines,
and subulate, obliquely-spined beak.

Snipe's-Bill MUREX.

This shell is principally found in the Mediterranean sea, and varies very much in size, spines, and colours.

PAPILIO JAÏRUS.

CHARACTER GENERICUS.

Antennæ apicem versus crassiores, sæpius clavato-capitatae.

Alæ (sedentis) erectæ sursumque conniventes volatu diurno.)

Lin. Syst. Nat. p. 744.

DELPHINUS GANGETICUS.

CHARACTER GENERICUS.

Dentes in maxilla utraque.

Fistula in capite.

CHARACTER SPECIFICUS, &c.

DELPHINUS cinereus, rostro elongato.

DELPHINUS Gangeticus.

Roxb. Ind. Res. vol. 7.

Quem depinximus Delphinum norunt Indi nomine *Soosoo*. Horum in Gangi flumine congregantur interdum plurimi. Longus est piscis, ut plurimum, pedes circiter duodecim. Color cinereus, subtus pallidior. Maxillæ elongatæ admodum et graciles continent utræque sexaginta dentes. Delphina Gangeticum primus accurate descripsisse videtur Dominus Roxburgh in volumine septimo *Disquisitionum Asiaticarum*.

THE
GANGETIC DOLPHIN.

GENERIC CHARACTER.

Teeth in both jaws.

Spiracle on the head.

SPECIFIC CHARACTER, &c.

CINEREOUS DOLPHIN, with lengthened
snout.

GANGETIC DOLPHIN.

Narrow-Snouted INDIAN DOLPHIN.

The species of Dolphin represented on the present plate is occasionally observed in great multitudes in the river Ganges, and is known in India by the name of Soosoo. Its general length is about twelve feet, and its colour cinereous, paler beneath: the jaws are remarkably long and slender, and in each jaw are sixty teeth. This animal seems to have been first distinctly described by Dr. Roxburgh in the seventh volume of the Asiatic Researches.
